상기 논문의 저자가 논문에 인용한 2개의 Figure에 대하여 원저작권자로부터 게재허가를 취득한 후 이를 추가로 알려왔기에 편집위원 회의 결정으로 수정기사를 게재합니다.

Figure 1. (A) Nonabsorbable sutures are placed at the junction of the tendon-tuberosity interface and are not through the tuberosities. (B) Once the native humeral head is removed, the tuberosities with their respective rotator cuff attachments are mobilized for humeral canal preparation and later repair. Revised from the book of Matsen FA III, Lippitt SB. Shoulder surgery: principles and procedures. 2004. pp 632, 637, with permission from WB Saunders (Philadelphia).

Figure 2. The anterior fin of the prosthesis is aligned with the forearm in neutral rotation, and the lateral fin is positioned approximately 8 mm posterior to the biceps groove, establishing a retroversion angle of approximately 30 degrees. Revised from the book of Matsen FA III, Lippitt SB. Shoulder surgery: principles and procedures. 2004. p 638, with permission from WB Saunders (Philadelphia).
